

04-151

Skybeam is a wireless internet service provider that covers territory in Eastern Wyoming, Western Nebraska and Northern Colorado. We have had a lot of success bridging the digital divide and providing service to people who would otherwise not have any broadband services. We are able to provide these services because we have access to unlicensed spectrum and inexpensive equipment that provides adequate results in this spectrum. One of our primary concerns going forward is how to handle increased demand for services in the current spectrum, and how to handle Quality of Service issues in an unlicensed environment. We would like to see the FCC provide simple rules for utilization of the 3650-3700Mhz band along with equipment requirements that will allow vendors to make simple adaptations of their existing product lines to facilitate operation in this new spectrum. This will help us improve the quality of our services and continue to provide a much needed high speed internet connection to many places in rural America.
